DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/2/09 has been entered.

Rejections Repeated

2. The 35 U.S.C. 103(a) rejection of claims 1-12,22-25 unpatentable over Hockaday in view of Pratt et al. has been repeated as previously made in office action 10/22/08.

Response to Arguments

3. Applicant's arguments filed 4/2/09 have been fully considered but they are not persuasive.

In response to applicant's argument that Pratt teaches controlling the power transfer and not fuel transfer therefore does not suggest a transfer mechanism configured to transfer fuel in response to data received from a mobile electronic device, Pratt teaches a transfer mechanism configured to transfer fuel in response to data received from a mobile electronic device because Pratt teaches a control means that can vary the amount of fuel and oxidant reaching the fuel cell to control the reaction rate and also teaches measurement of the remaining fuel in the fuel storage container (paragraph 0023,0025).

In response to applicant's argument that Hockaday teaches away from a transfer mechanism to transfer fuel in response to data received from a mobile electronic device, Hockaday does not teach away from a transfer mechanism to transfer fuel in response to data received, Hockaday teaches away from conventional cell phones that have warning alert signal when the battery is low and determining the remaining energy capacity by using the voltage output level as an indicator of charge. Pratt teaches measuring means accessed by the fuel storage container controller to obtain the value of the remaining fuel in the fuel storage container in order to compute fuel gauging information such as power capacity remaining in the fuel cell power source, the amount of time the load device could be operated in different modes, the fuel consumption rate and the energy conversion efficiency (paragraph 0034).
